                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method (M1) for screening for an C anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 8447 sequences (given in ABL61644 CC to ABL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic CC activity and can be used in gene therapy. M1 can be used for screening CC anti-neoplastic agent, and can be used for producing a product which can anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC structure and/or properties of the agent. M1 can be used in the CC treatment of cancer such as colon, bereast, stomach, lung, thyroid, CC adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, CC infiltrating lobular cancer, squamous cell cancer, infiltrating ductal cancer, carcinoma, namillary carcinoma and with 's timen'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                B
                                                                                                                                                                                                                                                                        Qy
                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method (M1) for screening for an C anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in CC agent to be tested for anti-neoplastic activity, determining a change in CC comprises a sequence (S) selected from 8447 sequences (given in ABL61664 CC to ABL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic CC activity and can be used in gene therapy. M1 can be used for screening CC an anti-neoplastic agent, and can be used for producing a product which CC is the data collected with respect to the anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC treatment of cancer such as colon, breast, stomach, lung, thyroid, CC adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, CC infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine CC carcinoma, papillary carcinoma and Wilm's tumour.
                                                                                                                                                                                                                                                                                                     Matches 4268;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The CDNA sequence was obtd. by screening a one day old human brain CC stem CDNA library in lambda gtll with an antisense 33 base oligomer (3/mbek) complementary to the 3/ end of the murine bek coding sequence (2 (Arnbluth et al., Mol. Cell Biol. 8: 5541-5544), and using the CC resultant clone, lambda bek5 to rescreen the library. NIH 3T3 (CC cells were cotransfected with a 1:20 mixture of pSv2neo and the CC lone of the stream of the Sv40 promotor and cytomegalovirus (CC enhancer. Clones of bek transfected cells have increased binding (CC enhancer. Clones of bek transfected cells have increased binding (CC DNA sequencing. Receptor proteins encoded by this cDNA sequence may CC be used in pharmaceutical compons. to inhibit undesirable heparin-CC binding growth factor mediated cellular responses or to inhibit the CC binding of an opportunistic pathogen to human cells. Such undesirable (1 sation of tumours, mitogenic effects in psoriasis, arthritis, CC atherosclerosis and benign prostatic hypertrophy. The derived bek CC protein may also be used for screening drugs.

                 The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Young P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                     The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonucleotide that has a double-stranded structure consisting of all most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least part of one strand single-stranded segment of 1-4 nt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3361

14-SEP-1990;
A cDNA library prepared from human cancer cell line Kato III mRNA was screened with an oligonucleotide corresponding to amino acids 529-541 of chicken basic FGF receptor. Three positive clones were obtained. One was cloned into pUC118/119 to give pTB1229 (see

The complete FGF coding sequence was obtained by ligating the insert from pTB1229 to the DNA sequence of the plasmid pTB1281 insert which encodes the carboxyl terminus of the FGF receptor from Glu 533 onwards.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             õ
         A CUMA LIDRARY prepared from human cancer cell line Kato III mRNA was screened with an oligonucleotide corresponding to amino acids 529-541 of chicken basic FGF receptor. Three positive clones were obtained one was cloned into pUC118/119 to give pTB1228. The sequence of pTB1229 was the longest of the three clones. See AAQ14848 for pTB1228 which lacks nucleotides 134-478 and 1309-1314 of pTB1229 and has an A residue in stead of a T at the position corresponding to nucleotide 1029 of pTB1229.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28-DEC-1990;

                                                                                                                                                                                                                                                                                                        A cDNA library prepared from human cancer cell line Kato III mRNA was screened with an oligonuclectide corresponding to amino acids 529-541 of chicken basic FGF receptor. Three positive clones were obtained. One was cloned into pUCl18/119 to give pTB1228 (see AAQ14848). The complete FGF coding sequence was obtained by ligating the insert from pTB1228 to the DNA sequence of the plasmid pTB1281 insert which encodes the carboxyl terminus of the FGF receptor from Glu 533 onwards.

The library was prepd. from RNA extracted from BALB/MK epidermal keratinocytes. The etcl gene was present on a 4.2 kb transcript. Two initiation codons are present, although the second is thought to be the most likely candidate. The protein encoded by the sequence is described in AAR14280.

                                                                                                                                                                                                             Efficient of eukaryo
                                                                                                                          The ectl sequence encoding the KGF receptor was obtd. from a clone isolated from a BALB/MK epidermal keratinocyte DNA library prepd. using the lambda pcEV27 cloning sysem of the invention. The protein appears to typical transmembrane tyrosine kinase (see AAR10933 for details), closely related to the mouse bFGF receptor. See also AAQ10867.

This cDNA clone comprises the nucleotide sequence encoding the fibroblast growth factor receptor -2 (FGER-2) isolated from the regenerating forelimb blastema of an adult Notophkalmus viridscens (newt). It is part of the multigene family of FGFR involved in the expression of fibroblast growth factors (FGF) eg. acidic-FGF (aFGF). The cDNA clone is used for producing recombinant newt afFGF, which can be used to promote growth of cultured cell lines, e.g. cell lines used to produce other recombinant proteins, or to promote wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A cDNA clone, useful for producing recombinant protein - con DNA sequence coding Notophthalmus viridscens (newt) acidic fibroblast growth factor (aFGF)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a method for differentiating biological catchvitles among the full length form of acidic fibroblast growth for factor (aFGF) proteins and other non-acidic fibroblast growth factor (non-aFGF) proteins. FGF proteins are thought to be involved in wound the haling and tissue repair. The method comprises determining and comparing the mitogenic responses of Tr31-5-1 (AFCC CRL-12521) and Tr33-1-2 (AFCC CRL12522) cell lines to different forms of aFGF and non-aFGF proteins. The method may be used for differentiating biological contivities among the full length form and truncated forms of aFGF croteins and other (non-aFGF) proteins. The information thus obtained may be used to better understand the molecular basis of the multiple functions of FGF activity in physiological and pathological conditions. This understanding provides the basis for the rational design of both call grand and FGF receptor agonists and antagonists. The present sequence encodes bek-like newt fibroblast growth factor receptor FGFR2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                       28-DEC-1990;
27-APR-1990;
31-JUL-1990;
14-SEP-1990;
was screened with an oligonucleotide corresponding to amino 529-541 of chicken basic FGF receptor. Three positive clone obtained. One was cloned into pUC118/119 to give pTB1228. T sequence of pTB1228 is shorter than that of pTB1229 lacking nucleotides 134-478 and 1309-1314 (see AAQ14849).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2163

It is fibroblast growth factor (FGF) related with properties of a paracine effector of epithelial cell growth. The cDNA clone is used for producing recombinant newt aFGF, which can be used to promote growth of cultured cell lines, e.g. cell lines used to produce other recombinant proteins, or to promote wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A cDNA clone, useful for producing recombinant protein - con DNA sequence coding Notophthalmus viridscens (newt) acidic fibroblast growth factor (aFGF)

CURKEMT APPLICATION DATA:
APPLICATION NUMBER: US/08/070,165F
FILING DATE:
CLASSIFICATION: 435
TELEPHONE: (614)-293-8093
TELEPHONE: (614)-293-5631
INFORMATION FOR SEQ ID NO: 5:
SEQUENCE CHARACTERISTICS:
LENGTH: 2675 base pairs
TYPE: nucleic acid
STRANDEDNESS: double
TOPOLOGY: linear
MOLECULE TYPE: cDNA
HYPOTHETICAL: NO
ANTI-SENSE: NO
ORIGINAL SOURCE:
ORGANISM: NO. 5750365ophthalmus viridescens
DEVELOPMENTAL STAGE: Adult
TISSUE TYPE: Regenerating forelimb blastema
IMMEDIATE SOURCE:
LIBRARY: lambda 9t11
CLONE: KP23-1
POSITION IN GENOME:
UNITS: bp
FEATURE:
NAME/KEY: 5'UTR
LOCATION: 1.324
FEATURE:
NAME/KEY: CDS
LOCATION: 325..2511
FEATURE:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 6
